

Common Settings

Tabs

Directories

The '**Directories**' group is used to set the default directory paths for the different files used by **WSCAD 5**. With the different setting possibilities flexible network operation is possible, because every user has an own configuration file (s). When you enter path names, (e.g. for the contact-comb library, database, DB selection or DB Field renaming) a complete name with path and file extension must be entered. It is much easier first to select the field you want to change, and then to click on the 'Search' button. You get the standard Windows File Open dialog for selecting the file or path.

Hint

If there is no setting for the Project database, project management is automatically disabled.
